

# Rose ERP

## Inventory Management

In today's retail environment, you need a competitive edge. Keeping a tight control on your stock levels, keeping costs down, and visibility of your stock movements for employees and customers, in real time, are crucial in providing your business the efficiencies required to attain that edge.

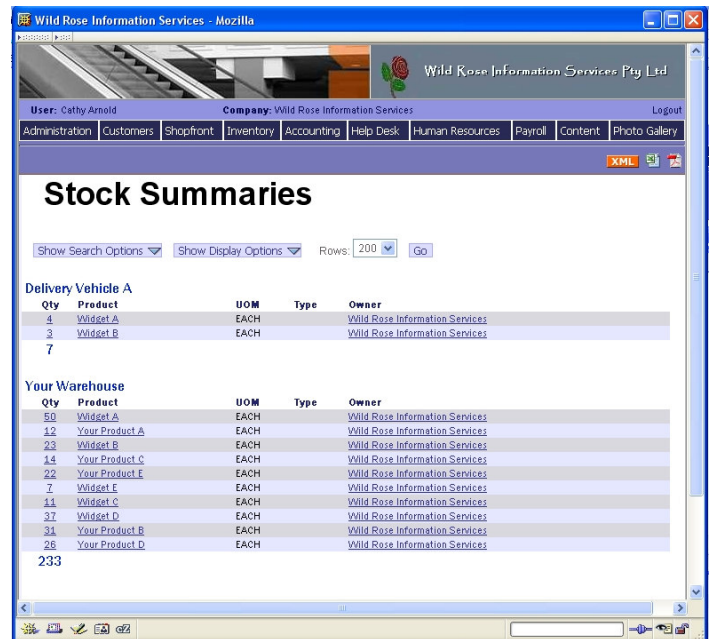

Rose ERP helps you leverage technology to advance effective business practices, effortlessly and securely exchange information, enables you to manage all inventory-related data 24 hours a day. Real-time access via your personal computer or PDA, makes Rose ERP a powerful tool in making educated business decisions.

### Stock Control

The stock levels of your products and raw materials can go up and down as goods are received, transferred, and sold. With Rose ERP, these summaries are maintained automatically, whether originating from receipting of purchase orders, manual stock adjustments, transfers, or the posting of sales invoices. A multi-warehouse environment and consignment stock are supported, so stock levels are maintained per location and owner. Optionally, stock levels may also be differentiated by product types, such as size or colour, or by quality levels.

### Serialized Items

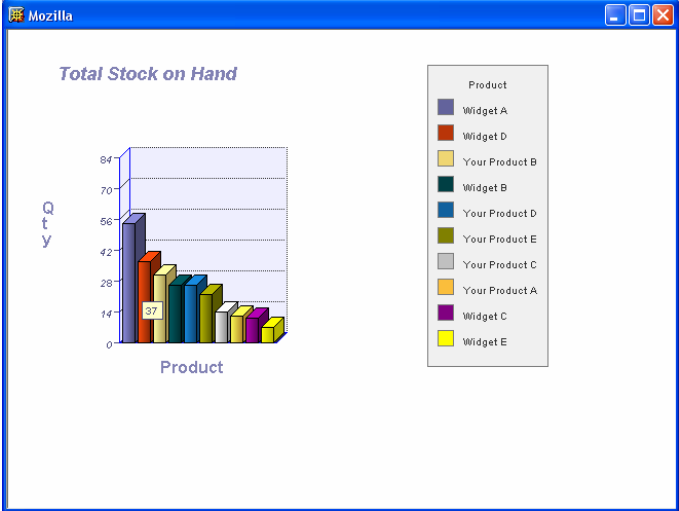

Products or raw materials may be nominated as serialized items, in which case each stock item will receive its own serial number. When these goods are received, transferred or sold, the system automatically asks which items are involved in the transaction, from a select list of available items. When receiving new stock, the next set of serial numbers is automatically proposed. The history of each individual item can be tracked from receipt, through the manufacture process if any, transfer, and sale. The item may continue to be tracked after sale, with any future repairs, other service tracking, or warranty information. Customized stock cards may be generated with all details of the item. Transfers and Sales Invoices can be configured to work solely from individual stock items or by means of traditional product / quantity.

### Replenishment

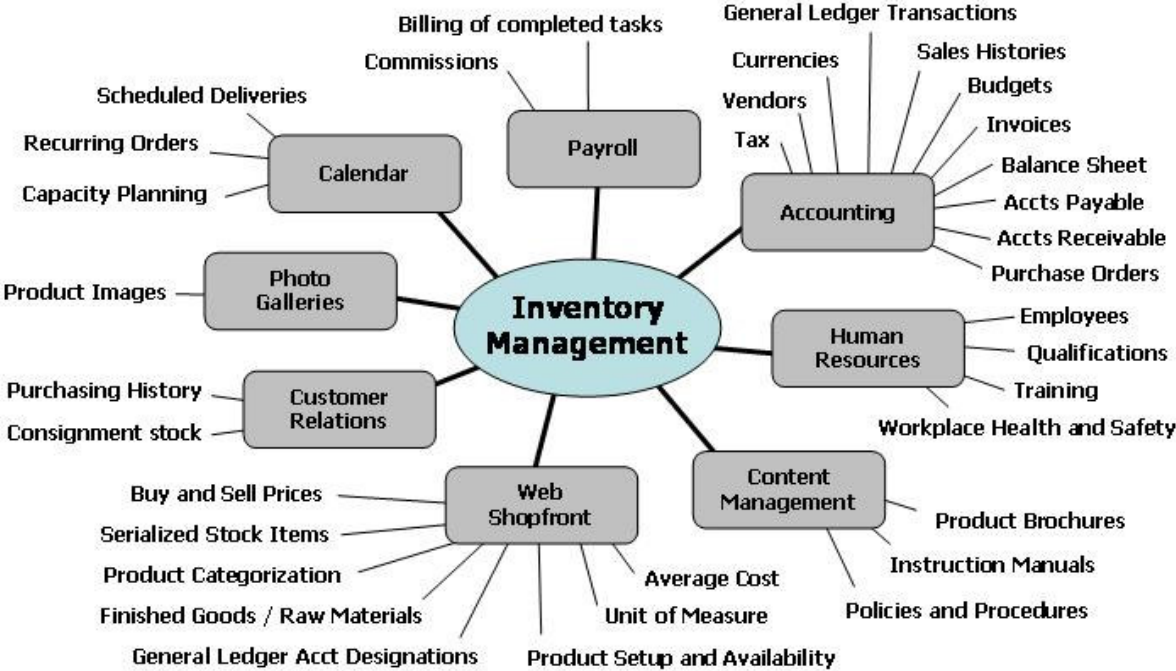

Rose ERP gives the option of automatic stock replenishment. You may designate minimum and maximum desired stock levels, and when the minimum threshold is reached, a purchase order is proposed for the appropriate vendor with easy acceptance or rejection options. This can significantly reduce the amount of human labour involved in keeping stock levels at desired levels.

# Stock Movements

Rose ERP gives you several flexibility options, such as having stock adjustments and transfers posted automatically or manually, whether or not stock levels are allowed to go negative, personal default warehouse, default adjustment type, and how cost of goods sold is calculated. These features can be very useful in identifying human errors or omissions related to your stock, and help customize the system to your company's business practices. Delivery dockets may be generated automatically from stock transfers. If third-party vendors are used for deliveries, the associated movements and costs can be tracked.

Inventory Management integrates neatly with other Rose ERP applications.
